K/NOT 3 - installation -

A digital chip (HEX-inverter: The NOT function) is taken from a pc mainboard and misused in an analog circuit as a chaos-chip.

Computers - as symbol-processing machines - are doing a trick within physical space which surrounds us.

By definition states between 0 and 1 are not allowed. This experimental setup uses these illegal states.

The generated signals spread into the vicinity via FM-transmitters, are reflected and modified by people and materials in numerous ways. Feedback is used also.

The whole room oscillates. The radios make this audible.
